

Enforcive Announces the General Availability of Enterprise Security for IBM i Version 8.3, Adding DB2 File Protection and standalone Field Encryption

Hackensack, New Jersey and Herzliyah, Israel - June 1, 2016 - Enforcive, a leading provider of security software for IBM i and Cross Platform Security products, announced the release of Enterprise Security for IBM i version 8.3. With this release Enforcive continues to deepen its capabilities to regulate and monitor access to the database as well as expand its reporting capabilities. The Enforcive/Field Encryption module is now available as a standalone product as well.

Highlights of the new functionality in this release include:

Enforcive/File Protection

With auditors increasingly checking the presence of controls for database access, Enforcive has enhanced its capability to regulate database activity. Through its File Protection capability Enforcive can regulate file access by function and the type of access to files, including for users with the most powerful user profiles. A full audit trail of file access activity is also available. Using File Protection, organizations can restrict the use of interactive SQL and other access types like Query interface, OPNQRYF, Dynamic SQL, WRKQRY or STRQRY for actions like read, delete, update, etc.

Field Encryption

Building on the success of the Field Encryption among existing Enforcive/Enterprise Security customers Enforcive has now also made the product available as a standalone product.

"Enforcive/Field Encryption is gaining traction in the market. Last year saw successful customer implementations in North America, Latin America, Europe and Asia especially among financial institutions and energy companies. Organizations are attracted by the product's ease of use and the flexible combination of the options of encryption, masking scrambling and field security," said Simon Bouganim, CEO of Enforcive.

Report Generator

Working closely with customers that are heavily using Enforcive/Enterprise Security in order to address regulatory requirements, Enforcive has extended the Report Generator adding 15 new reporting categories including Open Port, Inherited Special Authorities, File Shares, Function Usage, etc. For each category the Report Generator provides predefined reports as well as the possibility for an organization to define its own specific reports through granular tools including Boolean conditions.

System i Data Provider support for SSL

More and more IBM i organizations are looking to send IBM i events and logs to third party SIEM (Security Information and Event Management) and log management solutions. Enforcive customers have been using the Data Provider to convert Enterprise Security events they select to the syslog format and send them to leading SIEM products. In order to secure the export of events from Enterprise Security to third party solutions Enforcive has added an SSL option to its syslog transfer layer.

About Enforcive:

Enforcive provides comprehensive security solutions to help businesses reduce workloads, satisfy auditors, and improve responsiveness to security threats. For over three decades, Enforcive has been providing solutions within mission critical environments using platforms including IBM i, System z, AIX, Linux, and Windows. Our expertise and commitment to innovation enables us to offer the best of breed solutions to our customers.

Enforcive Enterprise Security™ for IBM i:

Enterprise Security for IBM i is a comprehensive security and compliance management solution for IBM's Power i (AS400). With intuitive GUI-controlled security, field encryption, reporting and compliance modules, this software suite enables system administrators and auditors to easily manage security and compliance tasks efficiently and effectively. Enforcive Enterprise Security has been synonymous with ease of use, providing security and compliance solutions within mission critical environments.

Enforcive Cross-Platform Audit™ (CPA):

The Cross-Platform Audit (CPA) is an Enterprise Log Management and Database Activity Monitoring (DAM) tool, for organizations running disparate servers and database platforms. The CPA consolidates and correlates platform-specific audit events in a single log and makes them available to system administrators and auditors in an easy-to-use interface. Server Platforms and Databases covered include OS400, z/OS, Windows, AIX, Solaris Linux, MS SQL Server, Oracle, DB2, MySQL and Progress.

Enforcive Cross-Platform Compliance™ (CPC):

CPC offers an intuitive toolset to check whether existing IT configurations are compliant with organizational and/or regulatory policies. It helps an organization create, document and maintain a clear security policy for its IT environment. The CPC allows an organization to define policies into templates. These templates can then be run to check for compliance in the IT environment of the organization. The output of the CPC is a log of policy deviations and deviation reports. Policy deviations can be enforced on the spot or through a scheduled job. The CPC is available for Windows, Linux, MS SQL Server, Oracle, AIX and IBM i.

Enforcive Password Self Service (PSS):

PSS is a cross platform password management tool where passwords can be synchronized across heterogeneous environment including IBM i, MS Active Directory, AIX, Linux and Open LDAP. In addition users have the possibility to reset their own password after authenticating themselves by answering security questions or receiving a token by e-mail/SMS. As such the PSS frees up help desk personnel for more mission critical tasks and enables the independence of regular users.
